

Unity Gameplay Test

Your prototype should recreate the **main gameplay loop** of the reference game.

Sled Surfers (Gameplay Reference) :

[Sled Surfers iOS](#)

[Sled Surfers Android](#)

Miraculous Ladybug & Cat Noir (Visual Reference)

[Miraculous Ladybug](#)

Launch

- The run begins with the player being **launched from a slingshot**.

Movement

- After launch, the character travels **forward downhill**.
- The player can **steer left and right** during the run.

Obstacles

- Include **at least two obstacle types**.
- Colliding with major obstacles should **end the run or significantly slow the player**.

Collectibles

- Add **coins or similar collectible items** along the path.

Run End

A run ends when:

- the player crashes
- the player loses momentum

- or the player reaches the end of the level.

Retry & Progression

After the run ends:

- the player should be able to **retry the run** (keeps the upgrades)
 - Include an **upgrade system** (persistent), usable before you start of the next run, for example:
 - launch power
 - speed
 - steering responsiveness
 - collectible value
-

Assets

Use the provided [Miraculous Ladybug asset pack](#) for the prototype visuals. Environment, interactables, UI and characters must be from the Miraculous Ladybug universe.

You may:

- rearrange assets
- modify materials
- reuse models in different ways
- add assets you think will fit the art style
- Feel free to contact us for any resources consultation
- Use AI or any free assets you want in the project
- Use any audio files you feel could improve the experience

The focus of this task is **gameplay implementation and code quality** alongside visual polish.

Technical Requirements

- Unity **2022 LTS or newer**
- C# scripting

- Clean project structure
 - Readable and maintainable code
 - Basic UI for:
 - start / launch
 - retry
 - upgrade
-

Deliverables

Please submit:

1. **Unity project** (zip file or Git repository)
 2. **Playable build** (optional but recommended)
 3. **README file** explaining:
 - Unity version used
 - how to run the project
 - implementation decisions
 - anything you would improve with more time
-

Time Expectation

You have **up to one working week** to complete this task.

We care more about **quality of implementation, code structure, and gameplay design** than about speed.

Focus on building a **clean, well-structured prototype** rather than rushing to finish quickly.
